

Hypermarkets versus traditional retail stores — consumers' and retailers' perspectives in Braga: a case study

Minoo Farhangmehr*, Susana Marques, Joaquim Silva

School of Management and Economics, University of Minho, Escola de Economia e Gestão, Campus de Gualtar, 4709 Braga Codex, Portugal

Abstract

Since its appearance in the mid-1980s, the hypermarket is a symbol of modernisation. It has dramatically changed not only the Portuguese traditional retailing structure but also the consumption behaviour. To understand the impact of hypermarkets, two questionnaires were used, one for consumers and the other for traditional retailers. The results show that, for consumers, the hypermarket is the preferred type of retail store, due to convenience (it is more practical) and low prices. The perception of traditional retailers is that the hypermarkets affected them negatively. The comparative analysis suggests that, although consumers do not have a negative opinion about traditional retail, they do not share the optimistic vision that traditional retailers have about themselves. © 2001 Elsevier Science Ltd. Keywords: Hypermarkets; Traditional retail; Buying behaviour; Store image

1. Introduction

During the last decade, Portugal has gone through profound political, economical and social changes, which have had a great impact on consumption. The joining to the European Economic Community (EEC) in 1986 created the necessary conditions for the installation in the country of large selling outlets. With a professional and innovative management, they quickly conquered a large market share, transforming the old-fashioned and traditional businesses, inherited from the past. In spite of the impact caused by hypermarkets, which resulted in their market leadership after only six years along with a strong crisis in the traditional retail sector, academics have almost totally neglected this issue.

This research was developed to overcome this gap. In the first part of the article, a historical analysis of the Portuguese retailing structure is presented. Then literature on store image is briefly reviewed and results of empirical studies in Portugal are discussed. Finally, the empirical study will be considered. This study was conducted in the North of Portugal, more precisely in Braga, known for being commercially active, a region with the youngest population of Europe, and the third most

populated in the country. The main objectives of this study are:

- to study historically how hypermarkets affected the different types of stores in Portugal. We also look empirically at the impact of hypermarkets on traditional stores, in a regional context;
- to identify the consumer perceptions towards hypermarkets and traditional retail, and what their choice of retail outlets are;
- to find out how retailers responded to the challenges brought by hypermarkets, and to compare their perceptions with the perceptions of consumers.

This study contributes to the understanding that consumers and retailers in most cases have different perceptions in relation to store image and shopping habits, justifying the need for consumer marketing research which is important in helping retailers implement a real marketing orientation.

2. The hypermarkets in Portugal: main changes

The history of hypermarkets in Portugal can be divided into three distinct stages: introduction, in the mid-1980s; growth, during the first half of the 1990s; and a decrease in the late 1990s. Each stage will be discussed shortly.

2.1. 1980s — the introduction of hypermarkets in Portugal

It is not possible to separate the appearance of hypermarkets in Portugal from its integration into the European Economic Community (EEC) in 1986. This was favourable to foreign investment and overall improvement of the economic situation. The French concept of store was first installed in the periphery of the two main Portuguese cities, Lisbon and Oporto, and rapidly expanded.

The new retail outlets experienced success due to a number of contributing factors. The positioning strategy was one main reason. Low prices and large assortments, supported by large spaces, free parking and a small shopping centre, conquered the consumer. Another issue was more of a sociological nature. In the hypermarket the consumers felt equal treatment attendance, without any social differentiation, while experiencing a certain sense of freedom to choose and to touch the products that, in some cases, they had never seen before.

At the same time, the strong growth and renewal of cars not to mention the improvement of public transportation, ensured consumers of central areas the necessary mobility to use the hypermarket. Due to their bargaining power, dynamism, dimension and attraction ability, these store formats became important development agents, capable of influencing the organisation of urban areas, by attracting more residents, with higher economic capabilities, and new life styles.

2.2. The growth stage

The great enrolment of consumers towards the hypermarket is reflected in the high annual growth rate in terms of sales volume, which achieved 72.7%¹ in 1989, and 52.3%, in 1990, clearly surpassing its competitors, namely supermarkets and groceries, as can be observed in Table 1 (Dionísio, 1991; Nielsen, 1995).

In this period, supermarkets went through a stage of some stagnation, with a great part of their clients transferring their primary shopping to hypermarkets. Nevertheless, this period witnessed the growth and modernisation of a number of supermarkets, which offered a good shopping alternative.

The smaller and more traditional store formats, which showed a strong competitive disability, suffered most from the competition. This resulted into a massive closing down of stores and considerable loss of their market weight. The reports from Nielsen shows that between 1981 and 1990, around 3300 small groceries had closed down (around 9270, between 1976 and 1990), and the

market share had decreased from 37.3 to 24.6% (39.9–24.2%, between 1976 and 1990) (Dionísio, 1987, 1991). A more dramatic decrease of this nature occurred in other European countries as well. For example, between 1982 and 1989, 22 954 stores in Italy, 10 148 in Spain and 10 407 in France went out of business (Martins, 1991).

2.3. Early 1990s — new generation of hypermarket and their strong growth

The unequal growth rhythms led hypermarkets, naturally, to the market leadership, which occurred in 1991, as can be observed in Table 1 (considering groceries in a desegregate level — large groceries and small groceries). The true “golden period” was experienced between 1988 and 1992, during which hypermarkets enjoyed a nominal growth rate of 396.8%, compared to 89.0% of the food industry. In annual terms, for the same period, hypermarkets grew at a rhythm of 49.3%, while supermarkets grew 21.4%, groceries 22.0%, self-services 2.1% and pure-food products — 3.2.²

This growth was sustained by innovations, not only based on marketing strategies, but also on appearance and facilities. While the price and assortment still remained very important, other elements such as commercial liveliness were emphasised. Thus, the hypermarket became a special retail outlet in large shopping centres, with diversified stores and with prestigious brands as anchor stores. Food and leisure areas were also developed, encompassing cinemas, play centres, gymnasiums and shared food areas.

The response of the consumer is reflected in the studies conducted at that time. In 1992, 23% of the supermarket clients inquired by Food Marketing International (FMI) considered the hypermarket as being their primary store (Distribuição Hoje, 1992). This percentage was the second highest, after supermarkets, which is much higher than the European average of 9% and very close to the 26% achieved in Sweden (FMI, 1995). Another national study undertaken in 1993 and directed to consumers in general, shows a more expressive rate, around 48% (Consumark, 1993).

2.4. Middle 1990s — softening of hypermarket growth

The growth and consolidation of hypermarkets continued through the 1990s, achieving their maximum value in 1995, with 42.4% of market share, according to Nielsen (1995) (see Table 1). A study on consumer buying, behaviour conducted by FMI on a national level, revealed an evolution from 1992, with 35% of the supermarket clients using the hypermarket as their primary

¹ The percentages are obtained through the following procedure: [(values of 1989-values of 1988)/values of 1988] < = > [(16.8%*635) - (11.7%*528)]/(11.7%*528)*100 = 72.7%.

² The same procedure, as foot note 1.

^bForecast.

store (Distribuição Hoje, 1992). This figure is considerably superior to the European average of 11%, surpassing the proportion of French consumers (23%), traditionally more used to this kind of outlet (FMI, 1995) (Table 2).

However, the annual growth rate started to slow down after 1994, resulting from a set of factors. The orientation of political and legal forces became more protectionist towards small commerce, raising barriers either to the approval of new units, mainly the larger ones, or to their functioning capability. The metric boundaries of large surfaces were changed,³ the licensing of new hypermarkets was reduced,⁴ and new restrictive laws concerning the opening hours of large store formats on Sundays and on holidays were created.⁵

³ The ceiling of 3000 m² of area defined by Dec.Lei 258/92 of the 20 November lowers to 2.000 m² of area, in councils with 30 000 or more inhabitants, and 1000 m to smaller councils, according to Dec. Lei 83/95 of 26 April.

⁴ Until the end of the millennium, only 12 more new hypermarkets are approved.

⁵ According to Portaria no. 153/96 of the 15 May, published in Diário da República, I Série, no. 113.

At the same time, the competition of supermarkets in general, and discount stores in particular, became stronger, in response to hypermarket restrictions and to a change in the consumers buying behaviour, now more receptive to modern nearby commerce. After the initial suspicion was overcome, discount stores became more and more an option, especially as a complementary store. This situation is shown in a study undertaken by Nielsen, in 1996, in which one out of two hypermarket clients showed his intention to use discount stores, if the same appeared in his area. In 1992 this intention was only 28% (Nova Publicidade, 1997).

The situation became more critical to hypermarkets in 1996 (see Table 1), with a growth of only 2.1%, against 30.0% of supermarkets, achieving its best performance in the whole decade. According to Nielsen forecast, the tendency maintained in 1997, with hypermarkets remaining stationary (0.2%) and the supermarkets growing 25.9%.⁶

However, another study on consumer buying behaviour, conducted in 1996 in the region of Braga, reveals

⁶ The same procedure, as foot note 1.

huge interest of consumers in hypermarkets, where 72.3% of the respondents used it as a major shopping outlet, while the supermarket was referred by only 27.4% (Farhangmehr et al., 1996).

Since the hypermarkets present significant differences compared to the traditional retail stores, store image literature helps us to better understand the significant changes observed in consumer shopping habits concerning the store patronage behaviour.

3. Store image: concepts and importance

The concept of store image, considered as the way consumers see the store in their minds, based on tangible and intangible attributes, deserved a great deal of academic and empirical attention, during the last four decades. The importance of studying the image is based on the assumption that the store possessing the most congruent attributes with the image desired by consumer will have a better chance of being selected and patronised (Martineau, 1958; Doyle and Fenwick, 1974–1975; Amirani and Gates, 1993; França and Figueiredo, 1993). Therefore, the store image can be used as a “*marketing tool*” (Engel et al., 1995), or as a “*competition tool*” (Reardon et al., 1995), providing useful indications to managers about the most and the least appellative attributes to consumers, and therefore, the insights for the marketing mix conception.

In spite of the importance and the long history of academic research into store image, the relation between image/attitude/attributes and store patronage/choice/preference is complex and polemic. In fact, even though the executives relate attitude and patronage, there are few studies that support that relationship (e.g. Monroe and Gultinan, 1975). The concept of relative attitude reinforces the complexity of that relationship (Dick and Basu, 1994). The authors conceptualise consumer loyalty as the relationship between the relative attitude towards an entity (brand/service/store/vendor) and patronage behaviour. Two dimensions, the degree of attitudinal strength (weak or strong) and the degree of attitudinal differentiation (existent or not) seem to underlie an individual's relative attitude towards an entity. Therefore, a weak but positively differentiated attitude may be more likely to lead to loyalty than a very positive but undifferentiated one; however, it is also important to consider the influence of normative and situational factors.

Besides being relative, the store patronage behaviour is also dynamic, and that is more explicit in buying situations of involvement, risk, evaluation of alternatives and information search (e.g. Monroe and Gultinan, 1975; Spiggle and Sewall, 1987; Darden and Dorsch, 1990). This dynamism is crucial in order to understand the changes in consumer behaviour.

3.1. Main attributes identified in the literature

The literature refers to a great diversity of methodologies, to varying temporal and spatial contexts, and to different store types, which make both generalisations and typology construction difficult.

Contradicting Martineau's (1958) emotional and affective perspective of store patronage, empirical evidences show a number of functional and objective attributes as the most important, such as: price (Doyle and Fenwick, 1974–1975; Bearden, 1977; Arnold et al., 1983; Hortman et al., 1990; Finn and Louviere, 1996); product quality (Doyle and Fenwick, 1974–1975; Bearden, 1977; Hortman et al., 1990; França and Figueiredo, 1993); assortment (Stephenson, 1969; Doyle and Fenwick, 1974–1975; Schiffman et al., 1977; Bearden, 1977; Finn and Louviere, 1996) and location (Stephenson, 1969; Schiffman et al., 1977; Arnold et al., 1983; Hortman et al., 1990; França and Figueiredo, 1993). Concerning intangible and emotional attributes, the most indicated are the atmosphere and store characteristics (Martineau, 1958; Stephenson, 1969; França and Figueiredo, 1993); sales personnel (Martineau, 1958; Stephenson, 1969; Schiffman et al., 1977) and advertising (Martineau, 1958; Stephenson, 1969).

3.2. The Portuguese context

3.2.1. Store image and consumer shopping habits

In Portugal, some empirical studies provide important information about consumer behaviour and its responses to the development of hypermarkets. Economical and social changes are major contributors for a growing fragmentation of consumers into multiple segments with different values and buying priorities. Consumers become more pragmatic, educated and demanding, learning how to manage money and time more efficiently. The focus on low prices was gradually replaced by a value for money perspective. The study developed by Food Marketing Institute (FMI) in Portugal (1992) confirms these tendencies (Distribuição Hoje, 1992). Concerning food, the most important attribute mentioned was quality, followed by price. It is precisely in the importance attached to price that Portuguese differ, considerably, from other European consumers, who indicate as most important the store cleanness, followed by the quality of fresh products and their assortment (FMI, 1995).

The Portuguese consumer has different reasons for preferring different store formats, either modern or traditional. The study of Proteste (1997) confirms the differences; in the case of hypermarkets, the main motives for preference, in decreasing order are low prices, the possibility of buying everything in the same place and the general appearance of the store. Several investigations emphasise the possible coexistence of different store

formats (e.g. Cardoso and Pereira, 1988) and others point out the relationship between the type of store and the type of products (Proteste, 1997; Farhangmehr and Silva, 1996; FMI, 1995). These studies show that, while specialised and traditional stores are preferred for fresh products, hypermarkets are preferred for shopping in general, and also for frozen food, groceries and beverages. The purchase of perishables in hypermarkets is reduced.

3.2.2. *Traditional retailers perceptions about hypermarkets*

As already mentioned, hypermarkets have deeply changed the Portuguese commercial structure. However, they are not exclusively responsible, as other changes (economical, social and cultural ones) have occurred simultaneously. Concerning the more direct effects of hypermarkets on different types of commerce, it is possible to verify that the major impact is felt on traditional retail and, in particular, on the food sector. The impact of hypermarkets is also significant on other types of retail, namely toys, stationery goods and household appliances; moreover, it is probable that competition gets more intense in other sectors, such as clothing and furniture (Pereira and Teixeira, 1990). A study on the impact of the first hypermarket in Lisbon, shows that all types of stores, with the exception of supermarkets, had negative financial results in the food sector, particularly butcheries, fish shops, groceries and sausage shops. Concerning the non-food sector, gardening goods, footwear, household appliances and furniture were the most affected (Santos and Cruzeiro, 1990).

A French study shows that the impact of hypermarkets is especially strong over non-specialised stores; stores that use normalised sales methods; generalist stores; very small stores operating on their survival limits; stores located near hypermarkets and with no alternative goods (Pereira and Teixeira, 1990). In Portugal, a study (Santos and Cruzeiro, 1990) verified that, in the food sector, the most affected stores are precisely the smaller stores (small areas, few employees and low sales volume) and the isolated stores (stores that do not develop partnerships with other retailers). In the non-food sector those relationships were not verified.

Concerning retailer's perceptions about problems in commerce, studies developed in Portugal (e.g. Santos and Cruzeiro, 1990; Novais and Costa, 1996) show that the most mentioned motives for crisis are, in the first place, related to political decisions. Retailers agree that their own competitive attitude and behaviour are among the causes for problems associated with commerce. However, in their opinion, these are not the major causes. In terms of the most important competitive factors of hypermarkets, traditional retailers mention lower prices, schedules, products assortment and better adaptation to consumer shopping habits. Concerning the way they

analyse themselves, they identify the attendance and the close relation with customers as their main advantages; in terms of their main weakness, they mention the small dimension.

4. Empirical study

Before explaining the methodology, two issues need to be discussed: the commercial structure of Braga and the concepts of traditional retail and hypermarket, avoiding possible ambiguities in terms of terminology.

The Commercial structure of Braga has suffered deep changes over the last few years, which is greatly related to the development of hypermarkets. In 1997 there were 17 retail stores per 1000 inhabitants in the county of Braga (DGCC, 1997), which compared to the national medium value of 14 is considerably high (DGCC, 1997). Simultaneously, Braga is the fifth district in terms of number of groceries stores, a typical format of traditional food retail (DGCC, 1997). At the time this study was produced, the county of Braga had two large hypermarkets.

The concept of traditional retail is used as encompassing small-sized commerce, i.e., groceries, minimarkets, pure food stores, specialised food and non-food stores and bazaars. Regarding specialised stores, clothing stores are considered as specialised ones. As for the concept of hypermarket, there is some confusion. According to Portuguese law, stores with over 2000 m² in counties with 30 000 or more inhabitants, and 1000 m² in other counties are considered as being of a large format. A.C. Nielsen, gives a different definition, considering the hypermarket as a commercial retailing establishment with a sales surface superior to 2500 m², explored in free-service system and commercialising a great variety of products. As data provided by Nielsen are widely used in Portugal and in the rest of Europe, it was decided to adopt them. In Braga, the medium size of hypermarkets is considerably superior, going from 8000 to 12 000 m², being one of them (Carrefour) one of the largest in the country.

4.1. *Methodology*

At the exploratory stage, a number of interviews and four focus groups (two with consumers and two with retailers) were conducted. Based on the information gathered, two questionnaires were developed, which after several pre-tests were applied to consumers and retailers.

4.2. *Consumers*

The method used for the data collection was a face-to-face interview, using a structured questionnaire, with closed-ended questions, conducted at the residence of the respondent and directed to the person responsible for

shopping in the household. The sample was non-probabilistic, respecting two main quotas: geographic and demographic. In the first case, judgement criterion was used with the important contribution from colleagues at the sociology department, who had studied the area, and also staff from local administration departments.

To draw the sample, the greater area of Braga was considered, which allowed for the inclusion of not only the residents of areas inside Braga, but also those living in the rural areas who do their shoppings in the city. The sample was drawn from seven areas distributed throughout three geographic levels (centre, intermediate and peripheral) of the county. These areas best represented consumers with different economical, social and geographical characteristics. Concerning the demographic quota, the last General Census of the Population, produced in 1991, was used. The number of questionnaires to be implemented in each area was proportional to the number of households residing in each area. For the selection of the households a systematic method was used. A map was drawn with all the streets chosen for the study, and the interviewers had precise indications as to the route to be followed in each period of time. They would select a sample unit in each five houses or five bells (in the case of apartments). A total of 500 questionnaires were completed and validated.

4.3. Retailers

The commercial establishments of the county of Braga, which were members of the Commercial Association of Braga, composed the sampling frame. After exclusion of non-relevant stores, a universe of 1011 establishments was obtained. The questionnaire was self-administrated and it was directed to the establishments' owners/managers. The sample was non-probabilistic, respecting two main quotas: geographic and demographic. The contribution from experts of the local trade association was crucial either to the geographic or to the demographic decisions. The sample encompassed the central and intermediate areas of the county, as almost all the stores are located in these areas. In order to compute the number of questionnaires that should be implemented in each area by commercial sector, the criteria of representativeness was used. For the stores selection, the systematic method was used, by sectors, with a constant interval. A total of 204 retailers responded to the questionnaire.

The decision to use two different procedures for data collection was based on our experience and the previous results obtained during the pre-tests of both questionnaires. The consumer respondents revealed some difficulties and low levels of motivation, and as such, a face-to-face administration was adopted. On the contrary, retailers were much more involved, considering it useful for themselves, which justifies the self-administration procedure.

5. Analysis of results

5.1. Consumers

5.1.1. Sample characterisation

In most households (85.6%), women are mainly responsible for the shopping. The majority of respondents (58.6%) have a considerably low educational level (mainly with only four years of studies — 42.2%), and are over 35 years old. Most respondents are married (82.0%), belonging to households of more than four elements (53.3%), with a family economy in which several members contribute to the household income.

Given the fact that it was not possible to directly obtain any data about the income, the possession by the consumers of certain goods was analysed. It was verified that the majority of respondents do not yet own a personal computer, a second car, a second house, a cable/satellite TV or a video camera, which, compared to the national data of 1990, leads to the conclusion that, in economic terms, important improvements did not occur. The majority of the respondents (75.7%) take less than 10 min by car from their home to the nearest hypermarket, and there is a relationship between the distance from home and the regularity (once to twice per week) they go to hypermarkets. It can be, therefore, concluded that the localisation factor or, more precisely, the distance measured in terms of time, influences considerably the periodicity of the act of going to the store. As to the amount spent monthly in hypermarkets, it ranges from PTE 11 000 to PTE 49 000,⁷ which is similar to the results obtained by the FMI study in Portugal (1995). We consider this a relevant issue, as the consumer, by spending a given amount in one store, limits, in a way, the amount he would probably spend in another one.

5.2. Shopping habits

Most part of the respondents (72.3%) frequently makes their purchases in hypermarkets, although we can also find a high percentage of consumers that buy in specialised food stores (58.3%), supermarkets (27.4%) and groceries/minimarkets (33.1%). These results emphasise the tendency found in other studies (e.g. Cardoso and Pereira, 1988; Farhangmehr and Silva, 1996) as to the coexistence of several retailing formats. However, the fact that hypermarkets stand out when compared to other type of stores does not match the results of other studies (Distribuição Hoje, 1992; FMI, 1995), according to which the supermarket was identified by consumers as being the primary store.

Hypermarkets are, in the same way, the kind of commercial space in which, clearly, most people enjoy

⁷ 1 PTE = 200,482 EURO.

purchasing (70%), which leads to the conclusion that buying in this type of store has, in a way, an element of pleasure in it.

Shopping in the hypermarket is generally done on a regular basis (around 52% buy once, twice per week), which goes against the decreasing tendency and the systemisation of visiting hypermarkets reported by Nova Publicidade (1997). This might be related to the fact that hypermarkets in Braga are located near large resident areas.

In terms of period of the day, the preferred ones are the morning and the afternoon, that is, the hours chosen by the consumers to buy in hypermarkets match the schedules practised by the majority of traditional retail stores. This result may be justified by the fact that a considerable part of the sample is composed of housewives and retired people.

Regarding goods bought in the different kinds of stores, the results show that detergents, household and personal cleaning products, groceries, beverages and dairy products are, clearly, goods that consumers buy in hypermarkets (66, 66, 61, 63 and 61%, respectively), in

detriment of traditional retail stores (21, 19, 23, 21 and 22, respectively). Besides these goods, fruit, frozen foods, toys, plants/gardening and tools/bricolage, are also purchased with greater regularity in hypermarkets than in traditional retailers, in spite of the small differences (see Table 3).

On the other hand, most of the respondents prefer to buy goldsmith/jewellery (95%), books (84%), footwear (84%), clothing (82%), furniture/decoration (93%) and household appliances (78%) in traditional retail stores. Some perishable goods as meat, fish and vegetables are also purchased more at traditional retailers (60, 58 and 41%, respectively), than in hypermarkets (28, 26 and 35%, respectively). Nevertheless, the difference compared to hypermarkets, especially regarding vegetables, is small.

The fact that the perishable goods are, generally speaking, bought in traditional retailers more than they are in hypermarkets is an evidence that emphasises the results of other studies (e.g. FMI in Portugal, 1995; Proteste, 1997; Farhangmehr and Silva, 1996). However, our study shows that the purchase of some perishable goods (vegetables and mostly fruits) in hypermarkets is becoming

Table 3
Shopping specific goods in different store types^a

	Hyper-market	Super-market	Traditional retail (specialized stores, groceries and minimarkets)	Market/fair	Others/don't know	Total	Total

^aNote: the question was about the primary store, but if there were respondents who use to buy with the same frequency specific products in two store types, they could mention both.

considerable. This result was not identified in the above-mentioned studies.

Another interesting result is that the consumers' responses suggest their almost exclusive preference for traditional retail shops when buying high involvement goods (e.g. household appliances). On the contrary, the most purchased goods in hypermarkets are essentially convenience products and, consequently, of low involvement. As it is widely advocated in literature, the involvement and risk have strong implications in the buying behaviour, so it is important for retailers to know how to influence these variables.

Concerning the motivations that lead people not to buy goods in traditional retail or only in traditional retail, the two main motives are: first, it is more practical to buy all the goods at the same time in hypermarkets/supermarkets and, second, the price in traditional retail shops is higher. That is, convenience and price are factors that determine why consumers do not buy in traditional retail; and prefer one kind of store to the other. These results suggest a consumer that is more pragmatic in his choices, and more concerned with the management of his money and time. Even though the answers refer to motivations why people do not buy some given products in traditional retail, the results correspond to other studies, namely the Proteste (1997), which highlights low prices and the possibility of buying everything in the same place as main reasons for consumers to buy in hypermarkets.

5.3. Retailers

5.3.1. Sample characterisation

Most of the establishments in the sample were in business for a long time (31.6% for more than 20 years); 80.4% have a small number of employees (between one and two); are small in dimension (65.3% have a total area inferior to 100 m²), and have low sales volumes. Sample characteristics, generally speaking, match the characteristics of Portuguese traditional retail, and, according to the FMI study (1995), those same characteristics explain why Portuguese retailing is behind other countries in the European Union. The majority of the respondents is the owner/manager and, the more represented kind of stores in the sample, are the specialised stores, namely the

decoration goods, footwear stores, household appliances and ironware stores; the groceries and minimarkets are also greatly represented.

5.3.2. Impact of hypermarkets on the different store formats

Most of the retailers (75.7%) have seen their own business affected by hypermarkets. Minimarkets and groceries were the most affected kinds of store (93.3 and 100%, respectively), confirming the results of other studies (Santos and Cruzeiro, 1990). When asked about the impact of hypermarkets, retailers respond that their business was negatively affected along all these dimensions: number of clients, sales volume, profit margin and profit (see Table 4). These results reflect, in a way, the concerns of most Portuguese retailers.

Retailers were also asked about the impact of large formats on traditional retail in general. While 75.7% of retailers found their own business affected, 85.1% of retailers consider that this kind of commerce was negatively affected. According to the respondent's opinion (more than one answer could be given), the most affected sectors were groceries (189 answers), household appliances (156 answers), toys and gifts (111 answers) and stationery goods (85 answers). According to 92.2% of retailers, groceries are the most affected outlet. These results match other studies (Pereira and Teixeira, 1990).

5.3.3. How retailers responded to the hypermarkets competition?

Using Chi-square tests (namely Cramer's V coefficient) we verify that the initiatives developed by retailers to face the competition of hypermarkets differ according to the kind of store. A certain non-response behaviour can be identified among groceries and minimarkets, especially when it comes to the investment in professional training (46.2% of minimarkets and 93.8% of groceries neither invested nor plan to invest in training) and the search for new suppliers (46.2% of minimarkets and 60.0% of groceries neither did nor plan on doing it). Is their lack of response responsible for such a tremendous negative impact? The reality is that their behaviour is somewhat incoherent with the fact that these were the ones mostly affected by hypermarkets. At the same time, it is interesting to note a very different attitude shown by specialised

Table 4
Impact of hypermarkets on specific dimensions of retailers personal businesses

	It has increased (%)	It has not changed (%)	It has decreased (%)	Total (%)
No. of clients	2.6	16.9	80.5	100
Sales volume	3.8	11.5	84.6	100
Profit margin	—	17.3	82.7	100
Profit	0.7	11.6	87.7	100

stores in terms of the increase in goods assortment (58.0%) and the search for new suppliers (52.8%).

Concerning the development of partnerships with other retailers for the purchase of goods and development of promotional campaigns, the great majority (about 75.0%) neither developed nor plans to develop, any kind of initiative. This situation was true for all kinds of stores. This shows a very insulated attitude on the part of retailers, which is inconsistent with the threat that large format retail stores represent. Overall, two different situations can be identified. On the one hand, it is undeniable that specialised stores express a dynamic attitude towards competition. On the other, there is still a large number of retailers that neither have done nor intend to do anything to change their disadvantageous situation.

6. Comparative analysis

The retailers' and consumers' attitudes match in terms of considering that hypermarkets offer more advantages than traditional retail regarding prices, promotions, assortment, novelties and schedules. They also share the opinion that traditional retail offers more advantages than hypermarkets in relation with the spent on shopping. Nonetheless, there is also a great difference between retailers and consumers, especially, at the level of perception of the quality of products, attendance, how easily the consumer can present complaints and how they will be attended, and payment terms, in both kinds of commerce. Concerning these specific aspects, traditional retailers have a much more positive opinion about themselves than consumers have about them. These differences suggest a certain lack of realism by traditional retailers, which can be detrimental for their future viability, and, as such, needs to be corrected.

However, the divergence in the perceptions does not imply that the consumers' opinion about traditional retail is negative. The essential matter is that, in spite of not having an unfavourable opinion towards traditional retail, the opinion towards hypermarkets is much more favourable, which may result in preferring hypermarkets in detriment of traditional retail. As literature suggests, in order to understand the consumer behaviour in terms of store choice, it is essential to understand his relative attitude (Dick and Basu, 1994).

7. Conclusions, implications and future studies

The hypermarket is the preferred kind of store by consumers, even though the consumers buy in several establishments and not exclusively in the hypermarket, which indicates that there is no "single loyalty"! While in hypermarkets, consumers buy essentially convenience goods with low level of risk; in traditional retail, they buy

essentially products of more involvement, which requires a more complex buying behaviour. The results also show that consumers evoke price and convenience for not buying certain goods in traditional retail, which reveals an attempt to optimise their time and money.

Concerning retailers, almost all of them feel they are negatively affected by hypermarkets. However, most of them have done nothing in order to change that reality, with the most affected being precisely the most passive ones. At the same time, traditional retailers have a very positive view of themselves, which reveals that they are, to some extent, far from reality.

The results indicate that it is inevitable that there should be a modernisation of commerce. In order to do so, first of all, retailers will have to make a realistic and critical examination of their potentialities, as well as of their vulnerabilities. Another implication has to do with the need and importance of ways of strategic co-operation of small retailers in the competitive game that opposes hypermarkets to traditional retail.

In terms of development of competitive advantages, it is necessary to create differentiation regarding those aspects in which consumers have a favourable view (not necessarily differentiated) towards traditional retailers, such as quality, attendance and complaints management. These aspects are essential for establishing personalised and confidence relationships with consumers, which is particularly important in complex and high involvement buying situations. In order to enhance those attributes, it is necessary to invest in professional training.

A new approach towards segmentation strategy is necessary. Results suggest that traditional segmentation, which assumes that certain types of products are exclusively bought in certain outlets, is no longer true for product categories such as food. However, there are few products that are exclusively bought by consumers in one kind of retail store.

Concerning future investigation, we suggest that separate studies for both the food and the non-food sector be undertaken. It would be important to compare hypermarkets and traditional retail with discount stores. Finally, it would be interesting to study thoroughly and separately, both the retailers that were negatively affected by hypermarkets and the retailers who have not suffered from that impact.
